The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer.

motif (HMG1 A box)"

/note= "DNA binding

```
CC Preferably, the expression levels of at least 10 genes are determined.

(1) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent under conditions effective for is useful as molecular markers, as drug targets, and for detecting, cataging, grading, assessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (2) and its expression conditions especially relating to prostate cancer. (3) and its expression conditions especially relating for expressing the polypeptide encoded by (1) can be used as target for therapy or drug discovery. (1) can also be used for expressing the polypeptide and thus continued as a specific binding partners of the polypeptide and thus continued applications to treat prostate cancer. The identification of the specific genes, and ground to treat prostate cancer. The identification of specific genes, and ground so the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical papelaries of the amino acid sequence of a protein differentially relations of angelence of a protein differentially really and a procession of a protein differentially really and a procession and sequence of a protein differentially really and a procession and a protein differentially really and a procession and sequence of a protein differentially really and and a procession and a protein differentially and and a procession and a protein and a procession and a procession of a protein differentially and and a procession and a procession and a procession and a procession and a proc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSEYRPKIKGEHPGL 120

New isolated polypeptide having a vertebrate HMG A box, useful for inhibiting a condition associated with an activated inflammatory cytokine cascade, e.g. endotoxic shock, myocardial infarction, asthma, HIV infection, malaria and diabetee
                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to high mobility group (HMG) protein comprising DNA binding motifs termed HMG A box and HMG B box. HMG A box or a non-naturally occurring HMG A box inhibits the release of a pro-inflammatory cytokine from a vertebrate cell. The methods and compositions of the invention are useful for inhibiting a condition characterised by activation of an inflammatory cytokine cascade such as endotoxic shock, rheumatorid arthritis, appendictis, peptic or duodenal ulcers, Crohn's disease, peritonitis, hepatitis, asthma, allergy, immune complex disease, sinusitis, bronchitis, embhysema, HVV infection, candidiasis, malaria, filariasis, amoebiasis, dermatitis, atherosclerosis, Alzheimer's disease, myocarditis, myocardial ischaemia, meningitis, multiple sclerosis, gout, cerebral infarction, neutitis, Goodpasture's syndrome, graft-versus-host therapy. The present sequence is human HMGI (also termed as HMGBI)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

This invention describes a novel method comprising using high mobility group B proteins (HMGB) as target molecules for development or preparation of compositions (for treatment, prevention or diagnosis of endometrial diseases, or as contraceptives. The products of the invention are used in kit for characterising the status of the endometrium, especially for presence of pregnancy or irregularities in the menstrual cycle. The proteins used in the invention can be HMGB! 2 or 3, or SP100-HMG, and the preferred interaction partner for HMGB1 is RAGE (receptor for advanced glycation end products). The products of the invention have gynaecological, contraceptive and cytostatic activity. HMGB is part of a nuclear transcription factor complex and, extracellularly, a ligand for the surface RAGE (receptor for advanced glycation end products) which is involved in tumour metastasis. The products of the invention are used to develop treatments, preventions or diagnoses of endometrial disease, particularly endometrions or diagnoses of endometrial disease, particularly particularly for detecting pregnancy or menstrual disease. This sequence represents the human HMGB1 protein used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MGKGDPKKPRGKMSSYAFFVQTCREEHKKKHPDASVNFSEFSKKCSERWKTMSAKEKGKF 60

This invention describes a novel method comprising using high mobility group B proteins (HMGB) as target molecules for development or group B proteins (EMGB) as target molecules for development or compositions (compositions (for treatment, prevention or diagnosis of endometrial diseases, or as contraceptives. The products of the invention or especially for presence of pregnancy or irregularities in the menstrual cycle. The proteins used in the invention partner for HMGB1, 2 or 3, or SP100-CC HMG, and the preferred interaction partner for HMGB1, 2 or 3, or SP100-CC HMG, and the preferred interaction partner for HMGB1, 2 or 3, or SP100-CC FMG, and the preferred in the invention named of the invention have gynaecological, contraceptive and cytostatic activity. HMGB is part of a nuclear transcription factor complex and, extracellularly, a ligand for the surface RAGE (receptor for advanced glycation end products of the invention are used to involved in tumour metastasis. The products of the invention are used to develop treatments, preventions or diagnoses of endometrial disease, particularly endometrious and methods for assessing status of the endometrium, also contraceptives and methods for assessing status of the condensitium, particularly for detecting pregnancy or menstrual disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      high mobility group B protein; HMGB1; HMGB2; HMGB3; endometrial disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Developing treatment and diagnosis of endometrial disorders, using high mobility group B proteins, or related nucleic acid or interaction
                                                                                                                                                                                contraceptive; endometrium; pregnancy; menstrual cycle irregularity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    are associated with carcinomas. The sequences are useful for: (i) for screening of bioactive agent capable of binding to Carcinoma Associated Protein (CAP); (iii) for screening of bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vii) for inhibiting the activity of CAP; (ivi) for treating carcinoma; (viii) for neutralizing the activity of CAP; (ivi) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ivi) for determing carcinoma are neutralized (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP. Note: This patent is an equivalent to basic patent US2002182586AI, for which no sequence data was published

This invention relates to a novel vaccine for promoting amyloid beta 42 aggregation inhibitory effect and/or amyloid beta 42 phagocytesis by microglia, which comprises a high mobility group protein 1 (HMGI), its partial peptide, or its salt. The invention may be useful for the production of compounds with a nootropic or neuroprotective activity acting a promoters of inhibition of amyloid beta 42 aggregation or promoters of amyloid beta 42 phagocytosis by microglia. The invention may also be useful for the production of a vaccine. The invention is useful for prophylaxis and/or treatment of Down's syndrome or amyloid angiopathy or preventing brain amyloidosis such as Alzheimer's disease. The present sequence is that of the protein encoded by the human high mobility group protein 1 (HMGI) gene which may be used during the creation of the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò

The invention describes a pharmaceutical composition comprising a polypeptide comprising an HMGB (high mobility group box) B box or its functional variant to treat a disease or condition by increasing an immune response in an individual administered with the pharmaceutical composition. Also described are: an antibody attached to a polypeptide comprising an HMGB B box or its functional variant; stimulating or increasing an immune response in an individual in need of immunostimulation; and treating cancer in an individual. The composition is useful for stimulating or increasing an immune response in an individual. The composition individual in need of immunostimulation or for treating cancer in an individual. This is the amino acid sequence of human high mobility group box 1 (HMGI) that can be used to stimulate cytokine activity and increase immune response to assist in treating disease.

The invention relates to a polypeptide comprising a high mobility group box protein (HMGB) A or B box. The HMGB A or B box can inhibit release of a proinflammatory cytokine from a cell treated with an HMGB protein. The invention also relates to a purified preparation of antibodies that specifically bind to the HMGB B box but do not specifically bind to non-B conspitopes of HMGB, where the antibodies can inhibit release of a proinflammatory cytokine from a cell treated with HMGB, a method for effecting whether a compound inhibits inflammation, a pharmaceutical determining whether a compound inhibits inflammation, a pharmaceutical composition comprising an HMGB protein or an artibody that binds to the protein, an agent that inhibits TMF biological activity and a method of treating a condition in a patient characterised by activation of an inflammatory cytokine cascade. Effecting weight loss or treating obesity in a patient comprises administering to the patient an amount of the polypeptide. The polypeptide, antibodies, composition and methods are useful in treating obesity and conditions characterised by activation of an useful in treating obesity and conditions characterised by activation of an each of the condition and methods are useful in treating obesity and conditions characterised by activation of
                   Human; high mobility group box 1; HMGB1; HMGB; HMGB A box; HMGB B box; proinflammatory cytokine; weight loss; obesity; inflammation; inflammatory cytokine cascade; sepsis; allograft rejection; rheumatord arthritis; asthma; lupus; adult respiratory distress syndrome; chronic obstructive pulmonary disease; psoriasis; pancreatitis; chronic is particulis; burn; myocardial ischaemia; organic ischaemia; reperfusion ischaemia; Behcet's disease; graft-versus-host disease; Crohn's disease; ulcerative colitis; multiple sclerosis; cachexia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use, especially in vitro, of nucleic acids encoding high mobility group proteins for the following processes: angiogenesis (including in a wound bed), neovascularization, transmyocardial revascularization, wound healing, epithelialization and healing in cases of tooth or bone implants. The sequences and their encoded protein are useful for treating a very wide range of diseases:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of nucleic acids encoding basic DNA-binding proteins, and their translation or transcription products, for treating diseases associated with e.g. angiogenesis, neovascularization or wound healing, also for

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide equences at least 80% identical to the TAT nucleic acids and polypeptide and polypeptide and polypeptide and polypeptide and polypeptide and enthode and compositions for the treatment or TAT polypeptide; and methods and compositions for the treatment or TAT polypeptide, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosis of cancer in mammals. TAT polypeptides and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cervical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, inverse system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome addentification and in gene therapy. The present sequence represents a TAT polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSEYRPKIKGEHPGL 120

The present invention relates to new vascular endothelial growth factor (VEGF) proteins useful for skin healing of a skin graft onto underlying tissue. The method involves contacting a skin graft flap or underlying tissue with an agent chosen from vascular endothelial growth factor C (VEGF-C) polymucleotides, vEGF-C polympetides, VEGF-D polymucleotides, or amount effective to reduce edema or increase perfusion at skin graft or flap. The composition comprises a gene therapy vector that encodes VEGF-C polymotleotide. The VEGF-C polympetides agene therapy vector that encodes VEGF-C polymotleotide. The VEGF-C polympetides agene therapy vector that encodes VEGF-C polymotleotides. The VEGF-C polympetides are preparational X-B-Z or Z-B-X, where X binds VEGF-3, where Z comprises a heparin-binding amino acid sequence, and B comprises a performent linking X to Z. The VEGF-D polympetides, VEGF-D polymotleotides, and WEGF-D polympetides, VEGF-D polymotleotides, and WEGF-D polympetides, vEGF-C polymotleotides, vEGF-C polymotleotides, vEGF-C polympetides, VEGF-D polymotleotides, and NEGF-D polympetides or vEGF-C polymotleotides with susful in treating skin injury such as burns or skin cancer, skin grafts, cosmetic surgery, a liposuction procedure, or in reconstructive surgery. The subject is disbetic. The method is useful for improving post-surgical wound healing after reconstructive and cosmetic surgery and improves complications resulting comprised wound-healing difficulties, pain, edema, necrosis and behavising and wound-healing difficulties, pain, edema, necrosis and cischemia. The present sequence is amphoterin protein, which contains a heparin binding domain related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121 SIGDVAKKLGEMWNNTAADDKQPYEKKAAKLKEKYEKDIAAYRAKGKPDAAKKGVVKAEK 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to heparin-binding vascular endothelial growth factor receptor 3 (VEGFR-3) proteins and encoding polynucleotides. The heparin binding VEGFR-3) proteins are used for stimulating lymphangiogenesis or angiogenesis in a mammal, and for modulating the growth of mammalian endothelial cells, mammalian endothelial precursor cells or hematopoietic progenitor cells. The polypeptide may also be used for promoting recruitment, proliferation, differentiation, migration or survival of neuronal cells or neuronal precursor cells, and for treating neurodegenerative disorder, e.g. Alzheimer's diseases, Parkinson's disease, Huntington's disease, motor neuron disease, Amyotrophic Lateral Sclerosis (ALS), dementia, or cerebral palsy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                New heparin-binding Vascular Endothelial Growth Factor Receptor 3 ligands comprising prepro-VEGF-C, prepro-VEGF-D sequences or fragments, for treating neurodegenerative disorder, e.g. Alzheimer's, Parkinson's, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSEYRPKIKGEHPGL 120

Treating an immune pathology in an individual comprises administering an amount of a high mobility group box (HMGB) polypeptide comprising a vertebrate or a non-naturally occurring HMGB A or B box, or its immunosuppressive fragment

Claim 6; SEQ ID NO 1; 57pp; English.

The invention is based on the discovery that high mobility group box protein 1 (HMGB1, also known as high mobility group-1 or HMG1), when administered with an antigen, diminishes the antibody response to the administered antigen. HMGB1 has 2 DNA binding motifs, termed the A and B boxes. A claimed method of treating an immune pathology in an individual comprises administering a HMGB polypeptide comprising a vertebrate HMGB A box, or an immunosuppressive fragment of the vertebrate or non-natural HMGB A box. The immune pathology is induced by the administration of a non-human antigen, nonself material (e.g. a cell or tissue such as bone marrow cells) or sallwart to the individual, by the transplantation of an organ into the individual, or by infection from a microorganism. Claimed methods of pathology in an individual or decreasing an immune response to an immunosuppressive fragment of decreasing an immune response to an immunosuppressive fragment of the vertebrate or non-natural A box, or an immunosuppressive fragment of the vertebrate or non-natural A box, or an immunosuppressive fragment of the vertebrate or non-natural A box, a non-naturally-occurring HMGB A box, or an immunosuppressive fragment of the vertebrate or non-natural A box, a non-naturally-occurring HMGB A box, or an immunosuppressive fragment of the vertebrate or non-natural A box. Comprises administering a vertebrate or non-naturally-occurring HMGB A box, or an immunosuppressive fragment of these, and a vertebrate or non-naturally box. Comprises administering a vertebrate or non-naturally box. The HMGB polypeptide is preferably a HMGB polypeptide and may be truncated at the C-terminus. The autoimmune disease is allergy, culterative collits, Crohn's disease, asthma, rheumacoid arthritis, percent or sequence is that of the human HMGB protechin, which can be used as the cell HMGB polypeptide in methods of the invention.

detecting an HMGB polypeptide in a sample. The antibody (or antigenbinding fragment) binds to a vertebrate HMGB A box but does not specifically bind to non-A box epitopes of HMGB, and inhibits release of a proinflammatory cytokine from a vertebrate cell treated with an HMGB protein. A method of treating a condition characterized by activation of an inflammatory cytokine cascade comprises administering an antibody of the invention, or its antigen-binding fragment. The condition is selected from sepsis, allograft rejection, arthritis, asthma, lupus, adult respiratory distress syndrome, chronic obstructive pulmonary disease, psoriasis, peniconitis, burns, ischemia, Behcet's disease, graft versus host disease, inflammatory bowel disease, multiple sclerosis and cacheria, especially sepsis, arthritis, or lupus. The present sequence is that of the A box of human HMGBI ADY85012. An identical

nonhistone chromosomal protein HMG-1 - pig

C;Species: Sus scrofa domestica (domestic pig)

C;Species: Sus scrofa domestica (domestic pig)

C;Accession: A28897

C;Accession: A28897

B;Tsuda, K.; Kikuchi, M.; Mori, K.; Waga, S.; Yoshida, M.

Biochemistry 27, 6159-6163, 138

A;Title: Primary structure of non-histone protein HMG1 revealed by the nucleotide sequent

A;Reference number: A28897; MUID:89050965; PMID:3191113

A;Accession: A28897

A;Accession: A28897

A;Accession: A28897

Wolecular characterization of the canine HWGB1.";
Cytogenet. Genome Res. 101:33-38 (2003).
-!- FUNCTION: Binds preferentially single-stranded DNA and unwinds double stranded DNA (By similarity).
-!- SUBCELULAR LOCATION: Notclear (By similarity).
-!- SIMILARITY: Belongs to the HMG1/HMG2 protein family.
-!- SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10-MAY-2005 (Rel. 47, Created)

-!- FUNCTION: Binds preferentially single-stranded DNA and unwinds
-!- FUNCTION: Binds preferentially single-stranded DNA are a role in
double stranded DNA. Heparin-binding protein that has a role in
the extension of neurite-type cytoplasmic processes in developing
cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Nuclear and also cytoplasmic, associated with the plasma membrane of filipodia in process-growing cells, and also deposited into the substrate-attached material. SIMILARITY: Belongs to the HMG1/RMG2 protein family. SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STRAIN-Sprague-Dawley;
